Dr. 3. L. Tatus Talé University New Haven, Connections

Dear Dr. Tatums

Professor L. J. Cole reaches the retirement age this June. We plan to replace him with a young man who will work on the genetics of microorganisms. Can you suggest anyone whom we might consider for the post?

conservation to have attracted many students in this direction. We realize that consequently there is a very narrow field from which to draw. The first consideration is that we get a man of scholarly character who is well trained in at least one segment of the field, and who is interested in making himself compotent in the others. The position is primarily in research, although as the work developed there might be a call for some classroom teaching. You are familiar with our organization at Wisconsin and realize that we would went a man who could work effectively with certain other departments on the dampus, such as Agricultural Bacteriology, Flant Pathology and Biochemistry. The salary offered would be commensurate with the man's training and experience. We would be interested in learning of anyone whom you would have to suggest for the position.

Sincerely yours.

R. A. Brink Professor of Genetics
